Cyber Everywhere All at Once

A 4-Day Intensive Security Workshop

This isn't just training; it's a compressed experience of years of security work condensed into four intensive days.

The Experience

Step into the operational reality of two fictional companies facing real-world security challenges.

YieldBank is a financial institution building a core banking platform with legacy in-house development practices.

CodeOnion is a fast-moving startup building on cloud infrastructure with heavy reliance on third-party services

Who Should Attend

This workshop is designed for engineers, engineering students, security professionals, and compliance teams who want hands-on experience managing security across the full lifecycle.

Whether you're moving into security leadership or strengthening your practical skills, you'll work in small teams of 4-6 people, switching between both company scenarios to experience different architectural challenges.

What You'll Take Home

Beyond the knowledge and experience, you'll leave with practical tools ready to adapt to your own environment:

- Vulnerability prioritization framework
- BC/DR playbooks and plans
- Risk registers and treatment plans
- Customer-facing security documentation templates
- Audit readiness tools

You'll also gain something more important: the confidence that comes from going through the difficult process yourself.

Day One: Mastering Vulnerability Management

Your first day drops you into the chaos of discovering vulnerabilities everywhere. YieldBank's legacy code is riddled with SQL injection flaws and hardcoded credentials, while CodeOnion is leaking API keys and running outdated dependencies.

Morning: Introduction to common web application vulnerabilities and why they persist. Hands-on scanning of vulnerable applications and documentation of findings.

Afternoon: Building Secure Development Lifecycle (SDLC) policies, CVSS scoring and vulnerability prioritization, and presenting remediation plans. The day concludes with a real-life case review examining how organizations have handled major vulnerability disclosures and remediation efforts.

Day Two: Surviving When Everything Breaks

What happens when your database corrupts, your data center fails, or your cloud provider goes dark? Day two throws you into business continuity and disaster recovery scenarios where time is your enemy and perfect information doesn't exist.

Morning: Understanding disaster recovery and business continuity fundamentals. Practical disaster scenarios with RTO/RPO analysis and recovery exercises.

Afternoon: Building Business Impact Assessments (BIA) and Business Continuity Plans (BCP). Teams execute full disaster recovery simulations under pressure, making crisis decisions with incomplete information. The day closes with a real-life case review of major outages and how organizations managed recovery and stakeholder communication.

Day Three: Thinking Ahead

Now you shift from reactive firefighting to strategic thinking.

This day focuses on building risk registers, assessing threats, and making informed decisions about where to invest limited security resources.

Morning: Incident classification and response. Practical incident response exercise involving data breach scenarios. Development of incident management processes.

Afternoon: Risk assessment methodology and vendor management frameworks. Building practical risk assessment processes and registers. Teams present comprehensive risk strategies to simulated executive stakeholders. The day ends with a real-life case review exploring how organizations balance risk management with business objectives and budget realities.

Day Four: Showing Your Security Posture

Your final day answers the question every security team eventually faces: how do you prove you're actually secure?

You'll create customer-facing security documentation, prepare for an audit and respond to security questionnaires that can stop enterprise deals.

Morning: Understanding regulatory and customer security expectations. Building organizational security posture documentation and responding to customer security questionnaires.

Afternoon: Audit preparation and evidence gathering. Teams conduct simulated customer security meetings and audit sessions, presenting their complete security programs. The workshop concludes with a real-life case review of successful (and unsuccessful) audit experiences and customer security negotiations, followed by final Q&A and workshop wrap-up.

Detailed Agenda

Day one

- 09:00 - 9:15 - Arrivals
- 9:15 - 10:15 - Theory - Common web application flaws. Why do they happen, why won't they stop happening.
- 10:15 - 10:30 - Break
- 10:30 - 12:00 - Bring up the applications, run scans. We have a spreadsheet of the findings for each company so they can both edit and add the findings.
- 12:00 - 12:45 - Lunch break
- 12:45 - 14:00 - Discussion - what went wrong? Where in the overall product process should we take care of this? Who should take care of this? What are our rules?
- 14:00 - 14:30 - Both companies present their SDLC as a summary process. Both company teams debate if this is the correct process.
- 14:30 - 14:45 - Break
- 14:45 - 15:30 - Expert Discussions: Case study review
- 15:30 - 15:40 - Short break
- 15:40 - 17:00 - Final challenge: Each team selects which vulnerabilities are of highest priority, talks to the management for decision. After that, all teams get feedback.

Day two

- 09:00 - 9:15 - Arrivals
- 9:15 - 10:00 - Recap of Day one, answering AMA questions
- 10:00 - 10:45 - Theory - Disaster Recovery as a concept. Business Continuity as an umbrella concept.
- 10:45 - 11:00 - Break
- 11:00 - 12:30 - Practical exercise - let's do some disasters on our Platforms.
- 12:30 - 13:15 - Lunch Break
- 13:15 - 14:15 - Let's build our BIA and BCP framework
- 14:15 - 14:45 - Both companies present their BIA and summarize the process.. Both company teams debate if this is the correct process.
- 14:45 - 15:00 - Break
- 15:00 - 15:45 - Expert Discussions: Case study review
- 15:45 - 15:55 - Short Break
- 16:00 - 17:30 - Final challenge: A series of unfortunate events, disaster of both platforms. Process of active recovery with support and feedback.

Day three

- 09:00 - 9:15 - Arrivals
- 9:15 - 10:00 - Recap of Day two, answering AMA questions
- 10:00 - 10:45 - Theory - Incident classification and handling procedures.
- 10:45 - 11:00 - Break
- 11:00 - 12:00 - Practical exercise - let's react to an incident.
- 12:00 - 12:30 - Let's write a minimal incident management process
- 12:30 - 13:15 - Lunch Break
- 13:15 - 14:15 - Theory - Risk Assessment. How do we approach Risk Assessment in practice?
- 14:15 - 15:00 - Making your own minimal risk assessment
- 15:00 - 15:10 - Break
- 15:10 - 16:00 - Expert Discussions: Case study review
- 16:00 - 16:10 - Short Break
- 16:10 - 17:30 - Final challenge: Both companies/teams make a risk assessment. Prepare and present the risk assessment to the speaker as top management.

Day four

- 09:00 - 9:15 - Arrivals
- 9:15 - 10:00 - Recap of Day three, answering AMA questions
- 10:00 - 10:45 - Theory - Regulatory and customer expectations
- 10:45 - 11:00 - Break
- 11:00 - 12:00 - Practical exercise - Let's discuss our organizational posture, and write it down
- 12:00 - 12:45 - Lunch break
- 12:45 - 13:30 - Practical exercise - answer customer questionnaire and prepare for the customer meeting.
- 13:30 - 14:15 - Practical exercise - prepare evidence and document for the audit.
- 14:15 - 14:30 - Break
- 14:30 - 15:30 - Expert Discussions: Case study review
- 15:30 - 15:40 - Short Break
- 15:40 - 17:00 - Final challenge: Both companies/teams sit down with a customer and with an auditor.
- 17:00 - 18:00 - Wrap up, QA and AMA
